1 Audit the inputs
Receptors, treatment fields, initiation dates, survival and censoring provenance
2 Specify the landmark contrast
Day 90 eligibility and fixed initiation status; 1095-day RMST; clinical adjustment
3 Assess support
Events, complete outcomes, parameter burden, balance, weights and follow-up
4 Compare on the same RMST scale
Unadjusted KM, weighted KM, cross-fitted AIPW and standardized Cox outcome model
5 Challenge assumptions and stability
Adjustment, censoring, horizon, stabilizers, folds; known-truth simulation and stress scenarios
6 Interpret with limitations
Separate design changes from estimator dependence; report uncertainty and remaining identification limits
